

Module 1 – Project Overview

ServiceNow Incident: Implement Client Script & UI Policy

Project Title

Implement Client Script & UI Policy (Incident)

Problem Statement

Incident records require consistent and accurate data entry for effective triage, routing, reporting, SLA compliance, and resolution. Manual checking can result in incomplete or inconsistent information.

This project uses ServiceNow UI Policies and Client Scripts to control field behavior and validate Incident records directly at the user interface.

Objective

The objective is to demonstrate client-side controls that dynamically make fields mandatory, auto-populate values, control field behavior, and prevent submission when required conditions are not met.

Skills

Incident Management

UI Policy

UI Policy Actions

Client Scripts

Form Validation

Expected Outcome

When Impact is High, Assignment-related validation is enforced, Urgency is automatically set to High, and Urgency becomes read-only. High-impact Incidents cannot be submitted without Assigned To. Direct State changes from list editing are blocked.

Project Modules

1. Project Overview
2. High Impact UI Policy
3. Urgency UI Policy Action
4. onChange Client Script
5. onSubmit Client Script
6. onCellEdit Client Script
7. Testing & Verification
8. Conclusion & Best Practices
