

Module 6 – onCellEdit Client Script

Block State changes through Incident list editing

Purpose

Use an onCellEdit Client Script to prevent users from changing the State field directly from a list view.

Configuration

Name: Prevent state change via list edit

Table: Incident

Type: onCellEdit

Field name: State

Active: true

Script

```
function onCellEdit(sysIDs, table, oldValues, newValue, callback) {  
    alert('State cannot be updated using list editing. Please open the Incident.');
```

```
    callback(false);  
}
```

Verification

Open Incident → All. Double-click the State field in a list and attempt to change it. An alert should appear and the change should be rejected.

Form Update

Open the Incident record normally and change State from the form. The form-based update should remain allowed because the script targets list-cell editing.

Key API

callback(false) rejects the list edit operation.
